One of the most cost effective way of improving the performance of your netbook is to upgrade the internal memory of the netbook. Not all netbooks will allow this as some of the memory is non removable and some are fitted with the maximum memory that the netbook can take. To check the memory on your netbook we recommend you do a memory scan from crucial memory. <http://www.crucial.com/uk/systemscanner/index.aspx> find out if your netbook can take more memory, normally means removing the memory card that's in the netbook.

Each model of netbook will be slightly different on how you go about replacing the memory, we recommend searching the net/youtube as you will find a lot of people do video tutorials on how to replace the memory.

Some netbooks do require you to strip the machine down which some people might not be comfortable with.
